Investigation report

How did monthly active users change?

How did monthly active users change across the available months?

Data

Authorized synthetic SQLite
April - September 2026, UTC

Snapshot

2026-09-30 23:59:59 UTC metadata
Build
3a0dbed21d2f45958aefa2887a0cadd8

Run

Independent
2026-11-09
8 read-only queries

A Evidence appendix 5

How to read this report

- Checks identify the numbered evidence logs, which contain SQL and results.
- Unidentified sessions are excluded; session counts are not distinct people.

Terms used in this report

Term	Meaning
MAU	Distinct resolved people with a session touching the month.
Resurrected	Active this month, not the prior month, and signed up earlier.

01. Chapter

The answer

01

MAU increased every month from 7,937 in April to 11,447 in September: +3,510 (+44.2%). July growth slowed to +162 (+1.6%) before recovering in August (check 3).

Month	MAU	Change	Change %	Unidentified sessions
Apr 2026	7,937	-	-	2,286 (6.5%)
May 2026	9,134	+1,197	+15.1%	3,044 (7.6%)
Jun 2026	9,976	+842	+9.2%	3,184 (7.4%)
Jul 2026	10,138	+162	+1.6%	3,354 (7.6%)
Aug 2026	10,871	+733	+7.2%	3,480 (7.5%)
Sep 2026	11,447	+576	+5.3%	3,703 (7.6%)

02. Chapter
How we investigated
02

What data we used

- MAU v1.1: distinct resolved users with a session active span touching the UTC month. Complete months in [2026-04-01, 2026-10-01).
- Synthetic dataset; unidentified sessions are excluded (checks 2, 3, 8).

Investigation path

- Independent mode; inventory and build checks, Gold trend, Silver recount, identity coverage, growth accounting and acquisition-source partition.
- 10,400 users signed up before coverage; no pre-April activity is available (check 7).

03. Chapter
What happened
03

The movement

- Monthly gains: +1,197, +842, +162, +733 and +576 (check 3).

Who drove it

- June to July: 2,477 new + 2,908 resurrected - 5,223 churned = +162 (check 3).
- April to September source changes: paid social +2,436, organic +561, paid search +480, unknown +33 = +3,510 (check 6).

04. Chapter
Why it happened
04

- Supported accounting pattern: paid social accounts for 69.4% of net growth. First-touch classification does not establish causality (check 6).
- Specific product or marketing causes were not tested.

05. Chapter

Data quality and limits

05

Data quality

- Gold MAU matches the Silver recount; unidentified sessions comprise 6.5%-7.6% of monthly session records. Their impact on the number of people is unknown (checks 3, 4, 8).
- No ambiguous links, mismatches, or activity/profile exceptions found (checks 5, 7).
- One session crossed August to September and is included in both; the registry caveat claiming none cross is stale (check 8).
- Successful build records reconciliation, but the repository registry hash differs from the build hash. Source fingerprints were not recomputed (check 2).

Limitations

- The coverage interval is documented in the registry, not declared as timestamps in database metadata. The synthetic coverage label is not independent proof.
- Pre-coverage activity and causal mechanisms are unknown. Resurrected includes earlier registrants whose first observed activity occurs later.

06. Chapter

What to do next

06

- Monitor monthly MAU with unidentified-session share.
- Investigate the July slowdown and paid-social cohort behavior before attributing change to a cause.

Appendix

Evidence appendix

A

Check	Purpose	Evidence
1	Layer inventory	q01.jsonl
2	Snapshot and build status	q02.jsonl
3	Monthly MAU and growth accounting	q03.jsonl
4	Silver recount	q04.jsonl
5	Identity and time bounds	q05.jsonl
6	Acquisition sources	q06.jsonl
7	Startup and exceptions	q07.jsonl

Check	Purpose	Evidence
8	Overlap and unidentified coverage	q08.jsonl
