Investigation report

US subscribers at the end of September 2026

How many US users had an active subscription at the end of September?

Data

Authorized PocketToons SQLite fixture
September 2026; month-end UTC

Snapshot

User snapshot 2026-09-30 23:59:59 UTC
Build 3a0dbed21d2f45958aefa2887a0cadd8

How to read this report

- Check numbers refer to the individual JSONL evidence files in the accompanying folder.
- Silver is curated detail; Gold is a prebuilt summary; source history provides an independent recount.

Terms used in this report

Term	Meaning
Subscriber	A distinct user with an access-granting subscription period at the specified instant.
US user	A user whose recorded current country at the user snapshot is US.

01. Chapter

The answer

01

349 US users had subscriber access at the end of September 2026 (check 5).

- The approved month-end instant is 2026-10-01 00:00:00 UTC. Access includes active and cancel-at-period-end statuses (supporting metrics v1.1; lifecycle v1.0).
- The 349 include 37 users with cancel-at-period-end access. No qualifying US user had a flagged subscription period or overlapping qualifying periods (check 7).
- Source history independently gives 349 US users and 1,011 subscribers overall; the overall total matches Gold (check 6).

02. Chapter
How we investigated
02

What data we used

- Country is the recorded user country at the 2026-09-30 23:59:59 UTC snapshot, as confirmed by the requester. It is not a historical location measure.
- Access starts at or before the instant and ends after it or has no end; distinct users are counted once.
- Gold has no matching country dimension for this subscriber measure, so the answer uses Silver subscription access joined to Silver user profiles.

Investigation path

- Inventory and metadata (checks 1-4); Silver count (check 5); source and Gold reconciliation (check 6); quality and boundary checks (checks 7-8).
- A point-in-time count was requested, so no causal hypotheses or movement decomposition were necessary.

05. Chapter
Data quality and limits
05

Data quality

- No subscribers had missing profile or country in the source recount; zero qualifying US users had flagged or overlapping periods (checks 6-7).
- No US access periods start or end exactly at the boundary (check 8).
- The single recorded build succeeded and its reconciliation checks passed (check 3). The builder hash matches the local builder. The build registry hash differs from the current registry file; their equivalence is not established.
- The source recount agrees with the Silver result under the current documented rule. The snapshot identifier is metadata, not a verified content hash; post-build source freshness was not independently fingerprinted.

Limitations

- The database is a synthetic fixture, not a production customer population. Snapshot country is not proof of location at the historical instant.
- The repository directory has no Git metadata; neither commit nor download date could be verified. Files were inspected on 2026-11-09; AGENTS.md has a 2026-11-09 20:12:48 IST modification time, which is not evidence of download time.

Appendix

Evidence appendix

A

- q01: layer inventory; q02: snapshot metadata; q03: build status and reconciliation; q04: schemas.
- q05: country counts; q06: source and Gold reconciliation; q07: exceptions, overlaps and cancellation; q08: boundary records.
- Full SQL, results, timings and row-limit status are in the corresponding JSONL evidence files. No query was truncated.
