Investigation report

Mobile sessions: September versus August 2026

How many mobile sessions were there in September versus August?

Data

Authorized PocketToons SQLite fixture
August and September 2026 UTC

How to read this report

- Checks refer to the numbered JSONL evidence logs.
- Counts are sessions, including unidentified browsing visits.

Terms used in this report

Term	Meaning
Mobile	Sessions recorded as iOS or Android, as confirmed by the user.
Session	A continuous device visit, counted by its start time.

01. Chapter

The answer

01

September had 38,365 mobile sessions versus 36,295 in August, an increase of 2,070 (5.7%). Check 3.

- Android: 20,085 to 21,070 (+985). iOS: 16,210 to 17,295 (+1,085).
- September had 30 days versus 31 in August. Average daily starts rose from 1,170.8 to 1,278.8 (+9.2%).
- Mobile web cannot be identified from the platform field and is excluded.

02. Chapter
How we investigated
02

What data we used

- UTC start intervals: [2026-08-01, 2026-09-01) and [2026-09-01, 2026-10-01).
- The count by start is an ad hoc measure, not a registered standalone metric. The registry supporting metrics version is 1.1; its sessions-per-active-user numerator uses a month-overlap rule for identified sessions.
- Silver session-grain detail preserves all visits. Gold platform summaries count active users rather than sessions.

03. Chapter
What happened
03

The movement

Platform	August	September	Change
Android	20,085	21,070	+985
iOS	16,210	17,295	+1,085
Total	36,295	38,365	+2,070

Who drove it

- The two platform increases account for the total change arithmetically; this does not establish why usage changed.
- The user requested a count comparison, so a causal investigation was not performed.

05. Chapter
Data quality and limits
05

Data quality

- Checks 3-5: IDs are distinct within each month and platform; Bronze and Silver counts agree. Sessions occur on every day in both months. No ambiguous resolutions or mismatched links in those months.
- Unidentified mobile sessions included: 2,645 in August and 2,849 in September.
- One iOS session started in August and continued into September. Counting sessions touching a month gives 36,295 and 38,366, respectively (check 6).
- The documented activity coverage is April 1 through October 1, 2026, exclusive, but is not independently declared in database metadata.

Limitations

- The stored build was successful and reports source/session reconciliation. Its registry SHA-256 differs from the current repository registry; the builder hash matches. The counts are directly reconciled with Bronze but registry equivalence and build freshness have not been independently established.
- Snapshot time is the database metadata user snapshot, not a verified file hash or proof of freshness. The repository is a download without Git metadata; directory creation timestamp is November 9, 2026 20:12:48 IST, used as an approximate download date.
- Web includes 9,946 August and 10,349 September sessions with no mobile-device classification in the available platform field.

06. Chapter

What to do next

06

01 Confirm whether mobile web is required and obtain device classification if so.

02 Use the same session-start convention for future comparisons and monitor daily averages as well as totals.
